In any operating system we need to install applications to complete our day to day tasks. In the world of Windows, every program has a simple `Setup.exe` or `program.zip` file. On a Mac a package is a `program.dmg` or `program.sit` file. In both the **operating system** you can simply click it and it will ask you some very basic configuration questions like, do you accept the licence agreement or the directory you want to install the software to. Although in **Linux**, It seems tough to **install the programs/softwares** but **it's not true**.
